Get HANAReady from Centelli, powered by UiPath

Migrating from SAP ECC to SAP S/4HANA is a mandatory and important part of the technology backbone of any organisation. These migrations expose organisations often encounter unforeseen obstacles that prolong timelines and inflate costs.

A significant challenge lies in the unaddressed data points within the SAP ECC system. For example, open items in finance—such as outstanding invoices, unsettled payments, or incomplete transactions—can complicate the migration process. These open items require additional reconciliation efforts and can lead to data inconsistencies if not properly managed.

Other problematic data points include obsolete master data, redundant customer records, and custom code incompatible with S/4HANA. If these issues aren't identified and resolved early, they can cause substantial delays, increased effort, and even critical system errors post-migration. This will further help identify records that may require preparation ahead of the migration – the classic example being Customer-Vendor Integration. Finally, an often-ignored aspect of migration and migration planning is knowing when data changes are minimised: identifying the windows of 'least change' helps you optimise your migration plan – to migrate at times when the disruption to the business can be minimised and pro-actively reduce any business continuity concerns.

Get HANAReady, a proactive solution for smoother migration to SAP HANA

Our innovative solution is designed to tackle these challenges head-on by collecting and monitoring key data points within your SAP ECC system well before the migration begins. By identifying potential problem areas—such as open financial items and outdated master data – we enable organisations to address these issues proactively. This regular monitoring ensures that data anomalies are detected early, allowing for corrective actions that streamline the migration process.

The solution integrates seamlessly with your existing SAP ECC environment, providing real-time analytics and reports on data readiness. Tailored dashboards offer actionable insights into data quality metrics, highlighting areas that require attention. For instance, if the system detects a high volume of open invoices, alerts can be set up to prompt finance teams to reconcile these items promptly. Automations with UiPath can be built to assist the business in regularly closing down open items or identifying master data that is no longer in use.

By managing these critical data points ahead of time, organisations can significantly reduce the effort and time typically associated with migration. This proactive approach minimises risks, prevents potential system conflicts, and ensures a smoother transition to SAP S/4HANA. Ultimately, our solution not only accelerates the migration timeline but also contributes to cost savings by reducing the need for extensive data cleaning and rework during the migration process.

Embrace a smarter migration strategy that keeps your projects on schedule and within budget. With our solution, unlock the full potential of SAP S/4HANA faster and more efficiently, positioning your organization for sustained success in the digital era.

HANASync from Centelli, powered by UiPath

During the migration transition, organisations may find themselves in scenarios with multiple "live" SAP systems. This can arise for a number of reasons in order to address reasonable risks and concerns. For example, migration from a single source or multiple sources into a target system will unlikely be completed in a single step. Equally, a completed migration will have one or more subsequent phases wherein its satellite systems must also be migrated (or moved) to the target landscape.

This multiple-live-systems issue has a few implications: new master and transaction data can be created in either live system after the bulk migration of data. This data delta needs to be synchronised back to the source live system for business purposes and for the correct operation of satellite systems such as reporting and integration.

The transitionary state "mid-migration" HANASync is a data-centric solution that automates the synchronisation of transactional and master data between SAP systems. By leveraging UiPath's automation platform, HANASync achieves this synchronisation across typical SAP deployment and landscape scenarios, with full security considerations applied and does so in an auditable fashion. It is not a data migration tool; its purpose is to provide dual entry of transactions and master data for dual-system maintenance.
